

Business Requirements Document (BRD)

Customer Self-Service Account Management

Project	AI JIRA Story Generator — Sample Input
Status	Draft
Date	2026-07-23

1. Background

Customers currently have to contact support for routine account tasks — resetting a forgotten password, updating contact details, changing their registered email, reviewing recent account activity, or adjusting which emails they receive. Each of these is a small, self-contained change, but together they generate a steady stream of avoidable support tickets and leave customers waiting on things they should be able to do themselves in the product.

2. Business Requirements

ID	Requirement	Priority
BR-1	The system shall allow a customer to reset their own forgotten password from the login page, without contacting support, by verifying their identity via a time-limited link sent to their registered email address.	Must
BR-2	The system shall allow a signed-in customer to update their profile contact information (full name and phone number) from their account settings page.	Must
BR-3	The system shall allow a signed-in customer to change their registered email address, with the change only taking effect after the new address is verified via a confirmation link.	Must

BR-4	The system shall allow a signed-in customer to view a history of recent account activity, including login timestamps, approximate location, and device/browser used.	Should
BR-5	The system shall allow a signed-in customer to manage which categories of email notifications they receive (e.g., marketing, product updates, security alerts) from an account preferences page.	Should

3. Acceptance Criteria

3.1 BR-1 — Password Reset

- A "Forgot password?" link is available on the login page.
- Submitting a registered email sends a reset link that expires after 30 minutes.
- The reset link allows the customer to set a new password meeting the existing password policy.
- An expired or already-used reset link shows a clear error and lets the customer request a new one.
- A confirmation email is sent once the password has been successfully changed.

3.2 BR-2 — Update Profile Contact Information

- Account settings includes editable fields for full name and phone number.
- Phone number is validated for a plausible format before saving.
- Changes are saved immediately and reflected the next time the profile is viewed.
- A confirmation message is shown after a successful save; validation errors are shown inline without losing unsaved edits to other fields.

3.3 BR-3 — Change Registered Email Address

- Account settings includes an option to change the registered email address.
- Submitting a new email sends a verification link to that new address; the account's email of record does not change until the link is confirmed.
- The verification link expires after 24 hours.
- The customer's current (old) email address receives a notification when a change is requested, as a security signal.
- Attempting to register a new email already in use by another account shows a clear error.

3.4 BR-4 — Account Activity History

- Account settings includes an "Activity" view listing recent sign-ins, most recent first.
- Each entry shows timestamp, approximate location (derived from IP), and device/browser.
- The view covers at least the last 90 days of activity, paginated.
- The customer can flag an entry as "not me," which triggers a security notification email.

3.5 BR-5 — Email Notification Preferences

- Account settings includes a preferences page listing distinct notification categories (e.g., marketing, product updates, security alerts).
- Each category can be independently toggled on/off, except security alerts, which cannot be disabled.
- Preference changes take effect immediately for future emails.
- A confirmation message is shown after preferences are saved.

4. Out of Scope

- Multi-factor authentication changes.
- Changes to the password complexity policy itself.
- Account deletion or data export/portability requests.
- Support for changing a customer's username/account ID.
